
Subject: IDL 5.5 call_external passing strings

Folks,

Under IDL 5.5, if I call into my dll with call_external, passing a string into the C program as an IDL_STRING structure (as per the documentation, and which worked fine in 5.3) the pointer to the string, the "s" member of the structure, now points to invalid memory (address of 0x00000001 in my case), even though the slen member is right (21 bytes in my case). Is this a bug in 5.5, or what? Anybody else have this problem?
