
Subject: IDL 5.4 on Solaris? Please test

As noted in the "Capturing screen output" thread, a simple piece of code works for me under IDL 5.2.1 on Solaris, but fails under IDL 5.4 on the same machine. So I'd appreciate it if anyone who is running IDL 5.4 on Solaris could help me out:

1. Create a simple file containing two IDL commands:

```
$ cat runidl  
print, 'Hello world'  
exit
```

2. Now run it, redirecting the output

```
$ idl runidl > runidl.out
```

3. Does runidl.out now contain "Hello World", or is it empty?

Thanks.
