
Subject: Color Printer limitations - Postscript resolution

Hi,

I am trying to print some filled contour graphics on a color printer, but the printer seems to ignore them. Each time IDL warns us that the number of polygon vertices may exceed some printer capabilities when it is generating the postscript file. I have tried to reduce the number of contour levels up to 7 (which is not very much) in order to be below the limitations but it doesn't work. Does anyone have encountered this warning message before? How did you succeed in printing your files? I know that my problem is related to the printer (Tektronix Pahser II). Do you have any other references for new color printers with an estimated price?

Thanks for your answers.
