Leaving aside descriptions for the moment (although I do seem to recognize this from my own writing as the kinds of words you choose if you are waving your hands while you are searching your vocabulary), I think the dialogs are certainly operating system specific, and probably vendor specific. In other words, what comes up depends on what was installed when the printer was installed.

I suspect IDL has as much control over it as it does over DIALOG_PICKFILE, for example. As such, it is awfully hard to explain. I typically use DIALOG_PRINTERSETUP because that gives the use lots of options, and if they hit OK, I just assume they know what the hell they are doing. What else can you do?

Cheers,

David

That much I could figure out; what I don't understand is why they needed two of the things.

I've placed both a "Print Job" button and a "Printer Setup" button on my application's menu bar. I did that as a temporary measure while I tried to figure out which one I wanted to use. Based on your answer, I guess I'll keep them both. Hopefully, the user will be able to figure out by experimentation which one to use.

I think these two are there so that you never lose interest in IDL. I used JOB on my Mac and it worked great, allowing full setup. When I ran that code on Windows, it was nothing like it, so I went to SETUP. But on the Mac, setup is something different again.

I have not yet confirmed if, for even higher entertaining value, the action of these two also changes randomly on the same platform after a certain number of clicks or something.

Cheers,
Pavel
