Hi,

I've written a widget program that contains a base widget holding a series of radio buttons. I want this base to be insensitive until certain actions are performed. The problem arises when I try to sensitize the buttons by making the base widget sensitive: it doesn't turn on the radio buttons. The buttons themselves are sensitive on creation, so the problem is that desensitizing the base widget also desensitizes the radio buttons, but resensitizing the base widget does not sensitize the buttons. Strange. I can do each button individually, but would prefer to do all in one go.

This is a more serious problem for the slider_widget. When this is insensitive on creation and later sensitized I see it go from gray to active but the slider buar does not appear. I wonder if this is the smae problem of sensitivity not working its way down the widget hierarchy...

Well, it's not a show-stopper but it is annoying and I'd greatly appreciate any solutions that you guys know of.

The system is IDL 5.4 on win2k using the guibuilder.

Many thanks,

Mike
