Hi,

I am a newbie. I want to modify the demo program "Thunder Storm" that comes with IDL. It is 'd_vectrack' in demo dir. I have problem understanding how the data are read into it. Since the program restore 'storm25.sav' and 'storm25b.sav', they give the variables, 'P', 'T', 'U', 'V', 'W' and 'MB', 'PB', 'TB', respectively. However, the scoll down menu has 'P', 'T', 'M'. I don't see how the data are transfered to those variables. Has anyone done the similar job and willing to help me?

I think I need to know what variables pass those values. Or can I just replace the value of 'P' in 'storm25.sav' and let the program read it? (Will this produce the correct graph?).

Thank you in advance.
