I have two questions related to continental outlines:

- 1) Can the continents be filled-in with a color or pattern? How?
- 2) I want to contour an oceanic quantity around the continents. I'm aware of /overplot, but I get false effects near the continental boundaries since there is a "filler" value on the land locations. Is there a way to tell contour to ignore the unwanted (land) points?

Thanks in advance for any pointers on this.

-Steve

Would it help to set this filler value to something high, and then use the
MAX_VALUE keyword to tell CONTOUR to ignore them?

Bill Thompson

Thanks. That answers question #2 (don't know why I didn't see it before).
