Yo,

Just curious, have many people got good performance gains from multithreading in 5.5? I'm on a single processor (drat!).

Anyone like to share their findings - how much improvement, how many processors, what kind of programs? What platforms?

Cheers,

T.

Yo, don't bother with a detailed test - I wasn't looking for small margins. One might have expected multiples rather than fractions.

My own code's got this big, fat WHERE statement that would probably be just the right application. And loads of matrix operations too... Ah, but not sparse ones I see, back to the drawing board...

Ciao.
