Subject: map\_grid and western longitudes

Hi,

Does anyone know of a way to make map\_grid show longitudes increasing to the west (i.e. Mars-like). I can do it manually with the gridlabel keyword, but the problem is that my maps scale. Sometimes I look at 1x1 degree, and other times at the whole globe. map\_grid takes care of this for me, but if I override it and specify what longitudes I want, either there are too many or too few.

Any help appreciated. I can always edit map\_grid and all it takes is probably one REVERSE() statement to get it to work... But if that were true, RSI would probably have given me keyword. I am hoping that it is there and I have just missed it...

Thanks,

-k.
