Folks,

We are looking for a high-quality frame grabber to grab 24-bit color images from a light microscope. Does anyone have any experience with or suggestions for this sort of thing? It has to run with a dual-head video card.

Leads are greatly appreciated. I haven't been told that money is a problem. :-)

Thanks,

David

I use a frame grabber from Imagenation:

<http://www.imagenation.com/>

I have been pretty happy with it. They provide good support, and they even make drivers that run under DOS 6.0 :).

Cheers,

Dan
