Subject: library help -- multiple procedures in one file

This question is mostly aimed at people who build libraries for public
use (David, Craig, etc). I am putting together a lot of the little
useful routines I have written as a grad student into a library, and was
wondering, should I juse make EVERY procedure/function have its own
file? In PASCAL, I was a big proponent of nested functions;
functions/procedures really ONLY used by one other procedure or
function. But in IDL, those functions aren't compiled on the fly and
you have to open the darn function file and compile them all every time
you start idlde. Is there any way around this?

Cheers,
Chris
