Hi \*,

Does anyone have an IDL procedure/function, that uses SOCKET, and logs into the NASA OIG (Orbital Information Group), and downloads the latest TLEs for a satellite?

I have this code in Perl, C, and Bash, but would like it in IDL.

If no one has this, is there any interest in me posting the code once I have ported it?

-k.

OK, I have ported it.

If anyone is interested in the code send me an email. Remove the part about the SPAM from the above address...

The following documentation at:  
<http://orpheus.nascom.nasa.gov/~zarro/idl/sockets.html>

may help.

Hi Dominic,

I don't see anything about POST on that page. But the http class and the code is very useful. I have downloaded the code and will be using it.

Thank you very much.
