Subject: Format codes in IDL

Hi everybody,

I am having a problem applying format codes to 'NaN', i.e.
!VALUES.F_NAN. When I try to assign this value to some variable and
read it from the command line in Macintosh and Linux, it gives me
error that 'Format code ... cannot be applied to 'variable'. It gives
it for all format codes. The interesting thing is, I have one such
statement in my code, it runs okay under Linux machine, but crashes
under Macintosh. I do not understand this. If anybody has got any
experience regarding the same and would help me, I would appreciate
that.

Thanks,
Asti
