Subject: plotting vectors on maps

Hi All. I've been banging my head against the wall trying to get IDL to plot vectors onto a map. VEL, VELOVECT and their cousins work ok, however they all require gridded data. My data are a dozen or so more or less randomly located geographical points with X (East) and Y (North) velocity components. Does anybody have/know of a simple plot routine that accepts U,V,x,y as vectors, rather than 2-D arrays?

Thanks in advance!

david
