I have never had this problem before but now everytime I try to convert an ENVI vector file EVF to a shapfile I get the following error message:

ERROR

Problem: An error was encountered reading from this EVF file.

ERROR: make_array: variable is undefined: num_points.

I have tried everything I can think of. I am sure it is an easy fix. Any help would be great. I am working on ENVI 3.4 on a SunSolaris
