
Subject: switching PS device from color to b/w?

Once I write a color image to the ps device (using `set_plot, 'PS'`), I cannot get the idl session to re-set to b/w, is there such a command? Right now I'm starting a second idl session and doing all the greyscale work there. Basically, I'd like to send an option like `/nocolor` to the ps device so it will stop making color postscript. Is there any such command? I'm using idl 5.2 :(
