
Subject: WMENU on IDL for Windows

I've just been looking at IDL for windows, and apparently the WMENU routine is not supported. The documentation says that this is an outdated routine and widgets are a much better solution, which doesn't really help much if you've got lots of routines already written which use WMENU. Does anyone have a routine for the Windows version which does exactly what WMENU did? I would be very grateful.

Anyway, the problem with widgets is that they are different in IDL and PV-Wave (not to mention being harder to program), and one of the advantages of using IDL/PV-Wave is being able to use other people's code.

Thanks,

Matthew.
