Hi!

I have a structure called "info" with an item called "img" which is a pointer array. Each of these pointers point to an image (2D array).

IMG            POINTER   Array[5]

I want to be able to access the image via subscripts. Is it possible?  
What is the syntax?

So something like  
value=\*info.img[3][130,453]

I know this is invalid....but something along those lines. Right now  
my code does this, which is sloppy:

```
tmp=*info.img[3]
value=tmp[130,453]
```

I can't really find any info about doing this in the docs....  
Thanks!

Brandon Jones
