it may sound dumb but i have problems importing ascii.
The file I want to import looks like this

/path/filename.file
/path/filename.file

...

when using the toolbar button, I get the desired input, a struct
containg a field with as much strings as lines in the file.
But i like to use the ascii_read function, and this just doesnt work.
Well, it does work with a template, but then again I'm using this
graphical interface which I dont want to use.

There isn't a keyword in the read_ascii function, to say only on record
per row, each row is a recrod, at least I dont find it. Perhaps it has
something to do with the fact, that I want to import strings and not
integers.

any help would be appreciated
