
Subject: having IDL output to another X11 window

The documentation seems sure that I can cause IDL to output graphics to another X-Window (external development guide, Ch 19, p348):

"The IDL X Windows graphics driver can draw in windows it did not create as long as the window is compatible with the IDL display connection".

However, I can't find any reference as to how to do this. Specifically, I am developing a Motif application in which I would like to embed some IDL graphics (a map) in an existing display.

Thanks for your help, in advance!
