If you are on an X-windows system, you can fool around with the RESOURCE_NAME keyword. If you are on anything else (or you wish portable code), then I'm afraid you are SOL.

Cheers,

David

As always, thank you David. I guess I am SOL :-)

Let me ask you another quick question. I was trying to print out my object graphics hierarchy when I saw your example "printwindow.pro". Does it work with object graphics or it is only for direct graphics?

Why when I send my scene to the printer object everything that gets printed out looks much smaller than it should be. As I mentioned above I use object graphics, and I use the default UNITS (pixels) for my window. What do I need to do in order to print out my scene as it is on the screen?

Thanks again,

Lyubo
