Hi, I'd like to open one file in a directory. For example,
        openr,1,'d:\data\1.txt'
but next time maybe open 2.txt in that directory. I donot want to change the
code every time. Are there any method when the program excute at openr, a
window containing the files can jump out and then I can chose files in the
directory to be opened? Somebody told me Matlab code:
[fname,fpath]=uigetfile('*.*','Data'), but I donot use Matlab.

Best regards,
TOM
