Subject: builtin simplex?

I recently realized that a piece of code which compiled fine with IDL5.4 failed under 5.5a because of

"SIMPLEX: incorrect number of arguments."

The reason for that is that there must be an IDL function of the same name which expects different arguments. I did not find any reference to it in the help system and it does not show up with help,/fun. Does anybody know more about it?

The obvious solution was to rename my simplex.pro to my\_simplex.pro.

kind regards,

B.St.
