Hi,

It might be a faq, but i'm in a hurry and didn't find it on google. so ...

i've got a satellite image, and i only got lat/lon for some points. I'd
would like to get mlat and mlon to be array of the same dimensions of
the image, containing interpolated lon/lat for each pixel of the image.

so, my dream is:

georef,image,lon,lat,x,y,mlon=mlon,mlat=mlat

where image is the image (ie 5000x5000 array)

lon lat are known position (ie 500 array)

x and y are respective indice of lon/lat in the image (ie 500 array)

mlon and mlat are output array for interpolated lon/lat (ie 5000x5000 array)

map_path and map_image doesnt seem to be ok for me.

If someone out there have a such routine

Thanks
