Hi,

Hoping someone may be able to help. I know the beauty of the WHERE
function, and the importance of pointers, however, I can't get the two
to work together. For example...I use the ->GetValue('0000'x,
'0000'x) to read a value from the DICOM header, and the result returns
is a PtrHeap, but when I try to loop through this array using WHERE I
get an error. Any hints?

Thanks
