
Subject: plotting particle data with halos?

I've got particle data generated from 'smoothed particle hydrodynamics' code that I'd like to visualize using idl. Are there any routines that will plot particles with 'halos' instead of simple colored points? If you'd like to see an example of what we're doing, please see

www.astro.fit.edu/wood/100k34.gif

It's a simulation of an interacting binary star system that has an accretion disk. Color indicates temperature in the disk.

Thanks for any pointers -- I'm new to the group so I hope this isn't an FAQ.
