Hello All,
    I have two arrays A and B. I would like to
draw a ROI on image A and let's call the area within
the ROI as AreaA. Now I would like to manuplate the image
B in just the regions defined by the corresponding AreaA.
Arrays A and B are the same dimensions.
    On the same question, is there anyway I can save
the ROI information that I get from using XROI in a separate
array. I looked at the REGIONS_IN and REGIONS_OUT and did not
completely understand these keywords.
    Thanks,
Karthik.
