Hello All,

I am facing a problem with the "idldoc" utility which is used to produce the HTML documentation from the idl files.

When I tried the utility "idldoc" on an idl file I am getting the following error message and the processing stops. The platform is Sun solaris 8.

```
cmd-prompt> idldoc *.idl
idldoc: Preprocessor returned non-zero status 1
cmd-prompt>
```

Could any one please tell what is the preprocessor that is used by idldoc so that I can specify appropriate paths, etc.

I suspect that this problem is because of some environment related issues. Could any one please what are all the environment variables that will impact the behaviour of "idldoc"

thanks,
Subhakar.
