Hello,

I am using PV-Wave within a Fortran console application calling the routine cwavefor. After that the standard input doesn't function correctly.

Normally after an READ(*,*)-statement you type in some characters and after pressing the return-key the program goes on to the next line.

After calling cwavefor the program reads only one character and goes on without waiting for a return-keystroke.

Any idea what's wrong?

Regards from Heidelberg
Martin
