Hi there,

I am using IDL 5.5a on RedHat 6.2. A simple plot like scattered points is plotted on the xterm window. If I move another xterm window on top of it and move the top one around like an "eraser". The plot is gone !

Other case is that if this plot window is behind another xterm window. After plotting it and bring the plot window forward, nothing is shown.

What is wrong with it?

very strange and need some help about this issue.

thanks in advance

Sean
