Subject: IDLWAVE path to idl binary
Posted by Justin[2] on Fri, 26 Sep 2003 18:33:52 GMT

Hello All,

After all the evangelism I decided to try IDLWAVE as opposed to IDLDE
under Solaris 9. IDLWAVE is pre-installed on our system (only version
4.7 though). Sadly I can't even get the shell (C-c C-s) working. I get:

Seaching for program: no such file or directory, idl

I've tried adding the idl binary path to load-path in my
~/.emacs file and I've also tried setting idlwave-system-directory (even
though the docs say this is not needed under Unix).

"idl" works from the command line, although it is aliased rather than in
the path.

Any ideas?

Thanks,

Justin
