Thanks again to everybody who provided feedback.

I uploaded version 0.6.2

On some platforms the include files of the ANTLR part of GDL  
(gdl/antlr subdirectory) could not be found, due to a missing  
preprocessor option. This should now be fixed.  
Furthermore a bug with the # and ## operators.

And I noticed that in my hotmail account some messages concerning GDL  
were wrongly categorized as spam and automatically deleted.  
I changed the settings to not automatically delete spam messages  
anymore.  
Could therefore anybody who did not get a reply to his email please  
send it once more if still relevant.  
Sorry for the inconvenience.

Best regards,  
marc
