
Subject: Another strsplit question

Most functions in IDL will operate on arrays.
Is there a way to make strsplit allow this?

e.g.

```
s = ['I see the computer.','I am typing a message.','$  
'This is the idl-pvwave newsgroup.']
```

```
segs = strsplit(s,/extract,/some_option)
```

```
print,segs[0,0],segs[1,0],segs[2,0],segs[2,4]
```

RESULT WOULD BE:

```
I I This newsgroup.
```
