Hello

Can someone (David?) tell me how to get alternative labels on David's colorbar?

I wanted to ask you guys if I could avoid changing his program.

Here is my code:

```
print, names
help,names

colorbar, /vertical, $
  Position = col_pos, $
  Range=[0,r_levels(n_elements(r_levels)-1)], $
  NColors=n_elements(r_levels)-1, $
  Bottom=101, $
  Color=!P.color, $
  Divisions=n_elements(r_levels)-1,$
  /right, $
  TITLE='mm/3klst',$
  ytickname=names,$
  format='(A2)'
```

And here is the result from the print/help functions:

```
 0    1    2    3    4    5    10
15   20
NAMES      STRING  = Array[9]
```

Isn't the _EXTRA keyword supposed to pass ytickname to the AXIS procedure? And it it doesn't matter if names are a integer array and format='(I2)'

best reg.
Einar
