You are right about it not working when there are no lines to return.
This has already been found and fixed for IDL 6.1.
In 6.1, when there are no lines to return, the conn array is returned with
the contents [-1].
I'm sorry that I can't think of a good workaround.

Karl

```

I don't know why, but sometimes the answer pops up in my head a day later.

Use a CATCH block:

```

pro pt
  data = FLTARR(2, 500, 500)
  data[1,*] = 100000
  seeds = [[500,500]]
  catch, err
  if err ne 0 then begin
    print, "In catch"
    help, verts
    help, conn
    conn = [-1]
    catch, /cancel
  endif $

```

```
else $  
    PARTICLE_TRACE, data, seeds, verts, conn  
help, verts  
help, conn  
end
```
