
Subject: File_Delete Question

Any Windows gurus out there? Peter?

I have an IDL program that creates a file in one part of the program. Later, another part of the program reads the file and deletes it. However, I find that FILE_DELETE by itself doesn't delete the file. Instead, it gives a really unhelpful message that it "had a problem deleting the file". Really!?

To actually delete the file, I have to use FILE_CHMOD first, with the A_WRITE keyword set (!?). *Then* I can use FILE_DELETE and get it to work.

Any ideas why this might be the case? I'm running the program as the Administrator.

Cheers,

David
