
Subject: IDL vs MATLAB?

Hello,

We are an MRI research lab, and are looking into either IDL or MATLAB to process time-domain data from the scanner. The basic functions needed are FFT (multi-D) of the raw data, signal processing and 3-d reconstruction of images. Segmentation and volume rendering of specific features from the image data is important. We've heard a great deal about the 3-d display capabilities of IDL, and the signal processing powers of MATLAB. How do the two stack up against each other? Has anyone had a chance to compare the two?

Thanks,

David Fenyes (dfenyes@thesis1.med.uth.tmc.edu)
