Thanks. On my Linux box this doesn't work for an external Web page but it may not be hard to modify. ONLINE_HELP calls a script online_help_html located in the /bin directory of the IDL distribution.

This script seems to be hard-coded so that only a URL representing a local file will work, e.g. if the browser is MOZILLA

```
mozilla -remote "openURL(file:$1)" 2>/dev/null
```

so presumably 'file' could be replaced by 'http'.

P.S Sorry for the uninformative original subject name -- I hit SEND too quickly.

Well, you were probably excited. :-)

But we would all benefit from hearing from you more often. :-)

Cheers,

David
