I just had the GNOCHM developer test the new IDL v6.1 CHM file, and managed to get it working myself on a friend's workstation. It works well. To get it working yourself, you absolutely need to have gtkhtml2 version 2.6.1 or higher, or gnochm crashes when you access most topics (I had 2.6.0 -- what a difference .1 makes). I believe this comes with Fedora 2, or you can find it yourself. Note: gtkhtml3 is not used.

It's a bit slow to start, and internal links inside individual pages don't work, but the index and search feature do! As far as programmatic control (ala KEYHH on windows) for apps (like IDLWAVE) that like to pick help topics, this is in the works, but not yet complete. Everything is rendered pretty well (about as well as in Mozilla), and you can see a screenshots here:

turtle.as.arizona.edu/idl/gnochm_icontour.png

and

turtle.as.arizona.edu/idl/gnochm_convolver.png

Things are speedy once it starts up. You'll notice gtkhtml2 does not render Microsoft's illegal use of "Symbol" font in HTML documents, so certain (just a few) glyphs get messed up. You can trick Mozilla into displaying these characters; not sure if gtkhtml2 can be tricked as well. The major advantage over a pure HTML approach are the index and search features.

That said, it seems RSI has gotten the hint that PDF just isn't flexible, and will switching to a new HTML-based documentation system for UNIX users for the next release. But if GNOCHM works out its kinks and adds programmability by then, we might be able to use just the .CHM file for both Windows and Linux (not sure if there are similar programs for OSX).

There's also a third which I use all the time, xCHM. I have used it on Fedora with the IDL 6.0 documentation and I haven't had any problems with it. And for those Linux users interested in such things, it's licensed under the GPL.

<http://xchm.sourceforge.net/>

I don't use SuSE, but there are contributed RPMs on the downloads page.
You might want to give it try and see what happens.

<http://xchm.sourceforge.net/download.html>

The RPM for SuSE could not be downloaded because the site does not exist.
But I was able to compile it myself. It needs wxGTK-2.5.2, chmlib-0.35.

It works fine on SuSE too.

I see I could call it direct with the chm file, this is fine.

cheers
