Hi,

I am trying to animate some x-ray images of a spine cord. I would like to hear some advice about how to load in a loop all the images, so that they can be animated in the same xinteranimate widget. I have tried several ways but the error message of "one animation at a time" keeps popping up! Is it necessary to open a window per image? I have a *bunch*, so this is kind of cumbersome...

Any advice will be kindly appreciated.

Regards,
Imit
