Well, creating a save file is certainly something you should *consider*, but whether you should use it or not often depends on other factors. There are problems restoring objects in general. See this for example:

http://www.dfanning.com/tips/saved_objects.html

Although you are not likely to run into these problems with IDLanROI objects. Probably the *next* object you try to save. :-)

In any case, I often find it more convenient to just get the information I need from an object (e.g, the data) and save that in a regular binary data file. Then I can easily read the data file and recreate an object when I need it.

The only trick is to be sure to put enough information in the data file so you can read it again. Something like this:

```
myROI -> GetProperty, Data=theData
filename = Dialog_Pickfile(File='myroi.dat', /Write)
IF filename NE "" THEN BEGIN
Obj_Destroy, myROI
OpenW, lun, filename, /Get_LUN
WriteU, lun, Size(data), data
Free_Lun, lun
ENDIF
```

Then, when you want to read it:

```
filename = Dialog_Pickfile(File='myroi.dat', /Write)
IF filename NE "" THEN BEGIN
OpenR, lun, filename, /Get_LUN
sizeInfo = LonArr(5)
ReadU, lun, sizeInfo
```

```
data = FltArr(sizeInfo[1], sizeInfo[2])
 ReadU, lun, data
 Free_Lun, lun
 myRoi = Obj_New('IDLanROI', data)
ENDIF
```

Cheers.

David

Thanks David!

Saving the data size info before the actual data is a neat trick, wish I'd thought of it:)

Jeff

Well, after I hit the SEND button I realized I really didn't show you the neatest trick of all. The data array should really be created with the Make_Array function like this:

OpenR, lun, filename, /Get_LUN sizeInfo = LonArr(5)ReadU, lun, sizeInfo data = Make_Array(Size=sizeInfo) ReadU, lun, data

Free_Lun, lun

Cheers,

David
