Using *nix? If so, from the command line do:

cat File*.txt > NewTextFile.txt

The easiest way I can think of is in unix:

cat File*.txt > all_text.txt

If you were desperate to use IDL you could read each file in as strings,
then stick 'em together.

Ben

By the way, this won't give you want if you need to have the files concatenated in numeric order. To have them in numeric order, you'd have to use a loop of some sort to form the next file name and then concatenate that file's contents onto the large text file of everything.
