hello!

It is really important for me to get to see the whole image on the xinteranimate window.

Unfortunately I can only achieve this by decreasing the size of the frames and the size of the window. This decreases detail of the image.

How can I get a "zoom-all" on the xinteranimate window? or at least, do pan on the image?

these are the lines I am using to call xinteranimate, I thought TVRD will fix this issue but it doesn't.

```
XInteranimate, Set=[1000, 1000, 12]
```

```
XINTERANIMATE, FRAME = j, IMAGE = TVRD(0, 0, 1000, 1000)
```

Any thoughts???

Thank you,

Adhara
