I am not really profficient with IDL so I am wondering if anyone can give me some insight to do this.

I have black and white images. I need to erase from those images those black objects that do not present overlap with the black objects of the underlying image. At the end, I will have to end up with images that have only those black objects that are interconnected from the first image, to the last image.

Then, I want to build the resulting three dimensional objects as blobs with render.

Thank you very much,

Flor
