Subject: Landsat (GeoTIFF) data help...

I am using various Landsat data formats and would like help finding 2 things.

1) Has anyone come up with a smart way to deal with the ragged and offset band edges of geometrically corrected GeoTIFF and some FST formatted Landsat data?

2) The GeoTIFF data that I am using from Landsat has a file with metadata called *_MTL.TIF. Does anyone have any IDL code that will parse this metadata file and read all GeoTIFF band files into ENVI? ENVI does not currently have a reader for this Landsat format.

Any help or suggestions or thinking out loud would be greatly appreciated...
