Senior Software Quality Engineer

We have a great opportunity for experienced Quality Assurance Test Engineers to join our team. We are seeking two IDL programmers to test IDL from early development through to release. The successful candidates will be responsible for performing complex functional, application, regression and performance tests on moderate to large software projects, defining test objectives, and writing test cases to those objectives. Other duties involve setting up and running test cases for assigned modules, recording results in accordance with the Quality Process and providing feedback on required tasks, schedule estimates, testing progress and results. As part of the team, the person in this position will communicate with software developers, technical writers, and technical support on product issues, and assist product developers and technical support specialists in the solution of complex problems.

Minimum Required Skills and Qualifications:

  a.. Bachelor's Degree in computer science or the sciences, or equivalent experience.
  b.. Five + years of experience in product testing, research, or development.
  c.. Understanding of the software development process, including design, implementation, testing, and documentation.
  d.. Excellent communication and organizational skills.
Desired Skills and Qualifications:

  a.. Fluency in IDL Programming.
  b.. A strong working knowledge of modern programming languages such as C++ and Java.
  c.. Experience building and executing requirements-based test cases and writing test problem reports.
