Dear All,

I have a client server application which I am developing using IDL and C/C++. This application needs to be available to various end users which run on different systems (Linux, Windows, Unix, Mac).

The question is: can the IDL Virtual Machine handle this for me or do

I need to create a sav file for every different operating system ?

If I make calls to C/C++ code via IDL, does the end user need to have a C/C++ compiler to handle the calls ?

Sorry if this is a dumb question, but any help is really welcome.

Have a nice w/e.

Pepe
