Subject: Storing variables in multiple widgets applications
Posted by jesusin on Wed, 03 Nov 2004 17:16:33 GMT

Hi all,

i have read many things about user values and common blocks but still
donï¿½t find the best solution.

Imagine you have a top-level base with many children and many
parameters each. Which is the best way to store these parameters? I am
storing all the parameters in the user value of the top-level base,
but i donï¿½t think this is the best solution when you have many
parameters. Defining common blocks is something that has also many
disadvantages. I have thought about defining external objects or
saving the variables to .sav files. Which is the optimal solutions?
What do you think?

Thanks in advance,
Jesï¿½
