Hello,

I have a widget_button that calls a procedure "plot_function" :

```
row_base4 = widget_button(TLB, /align_left, value=' Plot  
' ,event_pro='plot_function')
```

The procedure is defined as:

```
pro plot_function, event  
    envi_plot_data, x,y  
end
```

How to pass arguments, such as X and Y, to the procedure plot_function ?

Thanks

Francois.
