Hello,

For example, considering 3 classes and drawing five polygons by class, we obtain 15 polygons...

The ENVI ROI tool allows to compute statistics for the 3 classes.

But how to compute statistics for each of the 15 polygons ?

Thanks,

Francois.

As a complement to the previous question.

Concerning the IDL xroi tool, how can I draw several polygons for a same class ?

For example, polygons 1-3 correspond to class 1, polygons 4-7 correspond to class 2, etc.

I managed to do it by calling xroi function n times for n classes. This implies that the xroi tool is also closed n times, which is not nice.

Thanks

François.
